JPMORGAN PAYMENTS · MERCHANT SERVICES · COMPANION TO THE LEADERSHIP DECK

Agentic commerce use cases: what to enable, in what order, and what each asks of us

Nine use cases, from shopper-approved checkout to machine payments, reconciled with the leadership deck's phases. It adds what the Agentic Commerce Build Plan (v4) covers that the leadership deck does not.

1 · WHAT'S NEW
Gaps, evidence and market moves since the leadership deck

2 · USE CASES
Nine use cases, how each works, what JPMorgan does

3 · BUILD
Capabilities each use case needs, mapped to our product

4 · RECONCILE
Where the two plans differ, and the edits we propose

The build plan adds three use cases we did not cover, a sharper sequence for the rest, and one fact that changes our ChatGPT assumption

TOPIC IN THE BUILD PLAN	LEADERSHIP DECK TODAY	WHAT WE DO WITH IT	PAGE
B2B procurement agents on JPMorgan commercial cards	Not covered	ADD A parallel use case where company policy, not consumer trust, carries the risk	12
Agent-referred checkout in the merchant's own app inside the agent	Not covered; closest is browser agents (P1)	ADD Now Walmart's route in ChatGPT and Gemini	6
Machine payments over MPP as well as x402	Watch only; x402 named, MPP not	ADD To the watch list, with a decision trigger	13
ChatGPT moved checkout into merchant apps (Mar 2026)	Phase 2 lists "ChatGPT through ACP"	CORRECT ACP becomes conditional on a platform committing	8
What JPMorgan can see of the agent in each authorization	Agent labels, without the per-route detail	SHARPEN Add an agent-context field for merchants	7
Replenishment versus conditional purchase	Both inside "delegated" (P4, P5)	SHARPEN Replenishment first; it is closest to card-on-file	11
JPMorgan as the ACP vault that mints capped tokens	"ACP adapter" only	SHARPEN The one acceptance build that changes our position	8
Evidence that shoppers want to approve each purchase	Asserted, not sourced	SHARPEN Forrester, Amex and Walmart data	3
JPMorgan–Mirakl, Meta Muse, Verifiable Intent, Paze at 165M cards	Not covered	SHARPEN Market moves and a Muse worked example	4, 9
Calendar waves (2027, 2028) and external gates	Gate-based phases, no dates	PARTLY ADOPT Keep gates; add two external gate tests	15

What the build plan does not cover and the leadership deck does: consent in the Chase app, the Decision Platform, liability allocation, the business-case model and JPMMS–Chase governance. This deck leaves those as they are.

Source plan: Agentic Commerce Build Plan v4 (17 slides, Oct 2026). Leadership deck: "Agent commerce: securing our position with a bounded, gated investment", 36 pages.

The evidence backs our sequence: shoppers want to approve each purchase, accept autonomy only for cheap repeat buys, and convert better in the merchant's own flow

SHOPPERS WANT TO APPROVE

3 in 4

are uncomfortable letting an AI agent complete a purchase and pay on its own, **even with preset spending limits**

Forrester, online adults in the US, UK and Canada, fielded Apr 2026

AUTONOMY ONLY FOR CHEAP BUYS

52% 15%

everyday low-cost items — high-value items

are comfortable letting an agent buy for them

Amex Trendex by Teneo, 2,005 US adults, fielded Aug 2026

THE MERCHANT'S OWN FLOW CONVERTS

≈1/3

Walmart's conversion for checkout inside ChatGPT, against shoppers who clicked through to Walmart. Walmart is moving to its own Sparky app inside ChatGPT and Gemini.

Walmart via WIRED, reported Mar 2026

WHAT IT CONFIRMS

Our Phase 1 is shopper-confirmed (mode A). Delegated purchasing stays in design until our own approval and dispute data justify it.

WHAT IT SHARPENS

When autonomy comes, start with low-cost repeat purchases at known merchants (replenishment), not open-ended buying.

WHAT IT ADDS

Agent volume increasingly completes in the merchant's own app inside the agent. We need to see and attribute that traffic, not only in-chat checkout.

Other 2026 surveys in the build plan (Omnisend, ACI, Riskified) point the same way; not independently checked. Walmart figure is one retailer's experience, not a market rate.

Seven months of market moves: wallets reached the new agents first, and JPMorgan already has one agentic partnership in market

DATE, 2026	WHAT HAPPENED	WHAT IT MEANS FOR US
5 Mar	**Mastercard and Google announce Verifiable Intent** Tamper-resistant record of what the user authorized; aligned with AP2 and UCP; open-sourced	A network-backed format for our evidence record. Read it into the evidence design.
Early Mar	**OpenAI moves Instant Checkout into merchants' ChatGPT apps** ACP continues as "infrastructure across the shopping journey"	ChatGPT is no longer a ready ACP checkout channel. Build the ACP vault only when a platform with volume commits.
10 Mar	**JPMorgan Payments and Mirakl announce agentic commerce at enterprise scale** Mirakl Nexus prepares catalogs for AI discovery; JPMorgan provides processing, tokenization and fraud	Our own channel for merchant onboarding and catalog syndication. Count it among our existing assets.
17 Mar	**Paze passes about 165M cards; Citi joins as first non-owner bank**	A bank wallet of real scale to offer agent platforms, if EWS agrees.
18 Mar	**Stripe and Tempo launch the Machine Payments Protocol (MPP)** Fiat and crypto; Visa helped write the card spec	A second machine-payment standard beside x402, backed by our largest competitor.
9 Jun · 27 Jul	**HSBC–Mastercard B2B pilot (Singapore); Visa–Lianlian first live B2B agent purchase**	Business buying is running agents under company spend controls now.
10 Jun	**Visa partners with OpenAI** Tokenized Visa credentials with spending limits, category controls and required approvals; no launch date	Agentic tokens will arrive at our merchants without a deal of our own. Be ready to accept them.
8 · 22 Sep	**Meta launches Muse; PayPal checkout confirmed** Link one-time cards in use; Shop Pay to be added; Muse asks the user to approve each purchase	New agents launch with wallets already attached. A PSP outside the agent flow becomes a pipe behind someone else's credential.

Sources: Mastercard newsroom; Digital Commerce 360; J.P. Morgan Payments newsroom; Banking Dive; Fortune; Glenbrook; Crowdfund Insider; Visa newsroom; PaymentExpert. Full list on the last page.

Nine use cases, ordered by how far the shopper steps back. Each maps onto a pattern and phase we already have, except B2B

WAVE 1 · CONVERT
Shopper approves in the merchant's or wallet's flow

1 · Agent-referred checkout
Our pattern: **new** · Phase 1 labels

2 · Wallet-delegated checkout
Our pattern: P3 agent wallet · Phase 1 labels

Money moves as an ordinary online card payment

WAVE 2 · JOIN CHECKOUT
Shopper approves inside the agent

3 · Network agentic token
P2, P4 · our Track A if a partner flow needs it

4 · Signed cart (UCP + AP2)
P2 · **our first live merchant path**

5 · Delegated token (ACP vault)
P2 · Phase 2, only if a platform commits

Agent carries the credential; passkey per purchase

WAVE 3 · WITHIN LIMITS
Shopper sets limits in advance

6 · Replenishment and renewals
P5 · Track B design → Phase 2 pilot

7 · Conditional purchase
P4 · Phase 2–3, after replenishment

Our differentiator: authority, limits, evidence

WAVE 4 · MACHINES
No human per payment

9 · Machine-to-machine
P6 · watch; decide on settlement later

Micro-amounts; often stablecoin or account rails

PARALLEL FROM WAVE 2

8 · B2B procurement agents
Company policy replaces consumer trust, so autonomy is acceptable now. JPMorgan sits on both sides: buyer's commercial card issuer and, often, supplier's acquirer. **Not in the leadership deck.**

Waves and numbering from the build plan; "our pattern" refers to the six patterns on leadership deck page 16, "phase" to its roadmap. Each wave starts on evidence, not a date.

Wave 1 needs no new payment rails: the agent hands off to the merchant or a wallet, and our job is to recognize, onboard and attribute the traffic

USE CASE	HOW IT WORKS	WHAT JPMORGAN DOES	PAZE LEVER
1 · Agent-referred checkout Live: Walmart's Sparky app in ChatGPT; Gemini expected	The agent researches and builds the basket, then hands the shopper to the merchant's own app or site inside the agent. The shopper signs in, sees a synced cart and pays as usual. The merchant keeps the customer and the data.	Verify the agent's signature against Visa's and Mastercard's agent directories. Help merchants register their own shopping agents and get listed as verified. Syndicate catalogs through Mirakl Nexus. Tag each payment as agent-referred.	Paze button in the merchant's app: bank cards with no typing
2 · Wallet-delegated checkout Live: Meta Muse with PayPal and Link; Shop Pay to follow	The agent pays through a wallet the shopper already trusts. The wallet holds the card and asks the shopper to approve in its own screen. The merchant receives a network token or a one-time virtual card that the PSP authorizes like any online payment.	Accept wallet tokens with their cryptogram in token fields, never as a card number. Wallets don't mark the agent, so take that from merchant-passed fields or website signatures. Recognize single-use agent cards such as Link's. Feed all of it into fraud scoring and reporting.	Paze as a wallet agents can call: about 165M bank cards, approved in the bank app

CAPABILITIES USED

A agent recognition · **B** merchant and agent onboarding · **C** attribution and risk baseline · **D** wallet and agent-card handling. All four extend what UPOP and our fraud stack do today.

EXIT METRICS FOR THE WAVE

Agent share of JPMMS volume · approval rate, agent versus human · disputes per 1,000 agent payments. These match "payment performance" and "authority and risk" in our scorecard.

Fit with our Phase 1: this is our Required row "agent identification, transaction labels, reconciliation and baseline reporting". Wave 1 widens it to traffic that never touches a protocol: merchant apps and wallets.

Sources: Walmart via WIRED and MarTech (Mar 2026); PaymentExpert and The Paypers on Muse (Sep 2026); Banking Dive on Paze (Mar 2026). Paze levers need Early Warning Services' agreement.

In Wave 1 the agent is invisible in the authorization. Only network agentic tokens carry it inside the payment, so we must collect agent context elsewhere

PAYMENT TYPE	WHAT THE AUTHORIZATION SHOWS	WHERE THE AGENT SIGNAL COMES FROM	JPMORGAN ACTION
Merchant's own app or site Use case 1	An ordinary shopper checkout; nothing marks the agent	The merchant's session data: app inside ChatGPT or Gemini, agent referral. Platform authentication reaches the merchant, not us.	Offer an agent-context field merchants fill; reward it with agent attribution reports
Wallet token Google Pay, Shop Pay, PayPal, Paze · use case 2	Token, cryptogram and token requestor ID, which names the wallet, not the agent	Merchant-passed context; TAP or Web Bot Auth signatures at the merchant's site; an AP2 payment mandate when a Google flow uses one	Verify signatures at the edge or in JPMorgan-hosted checkout; pass AP2 mandates through
Link one-time card Stripe-issued, used by Muse · use case 2	A card number: no cryptogram, no agent field	Stripe's card range is a hint, not proof. Stripe, as issuer, holds the full agent context and handles disputes.	Recognize Stripe card ranges so new-card agent sales aren't declined; ask Stripe for agent ranges
Network agentic token Visa Intelligent Commerce, Mastercard Agent Pay · use case 3	Token bound to one agent, with agent identity and approval data	The payment itself	Accept, verify TAP, pass agent ID and approval to the issuer

Proposed addition to Phase 1: an **agent-context field** in our merchant API (agent name, surface, referral, signature result), carried through settlement and reporting. Cheap to add, and without it "agent share of volume" undercounts everything except agentic tokens.

The Link point: with Link one-time cards, Stripe holds both the credential and the agent relationship; JPMorgan is only the acquirer. Network agentic tokens and Paze are how we improve that position.

Based on public wallet and protocol documentation as of Oct 2026, as summarized in the build plan; confirm payload details with Google, Shopify and Stripe. TAP = Visa Trusted Agent Protocol; Web Bot Auth = the IETF draft it builds on.

Wave 2 joins checkout inside the agent. Order by reach, then evidence, then position, and build the ACP vault only when a platform commits

USE CASE	HOW IT WORKS	WHAT JPMORGAN DOES	WHY THIS ORDER	PAZE LEVER
3 · Network agentic token	The linked card becomes a token tied to one agent. The shopper approves each purchase by passkey; the network checks the charge matches.	Accept Visa and Mastercard agentic tokens; verify the agent's TAP signature; pass agent ID and approval to the issuer.	**Reach.** Arrives at our merchants with no bilateral deal (Visa–OpenAI, Agent Pay)	Paze banks, Chase first, enable cards for agentic tokens
4 · Signed cart (UCP + AP2)	The agent reads the merchant's UCP profile and builds a cart the merchant signs; the shopper co-signs. A payment mandate flags the agent to the issuer.	List JPMorgan as a payment handler in merchants' UCP profiles; accept the wallet token; verify both signatures; forward the mandate.	**Evidence.** Strongest dispute record; live on Google surfaces and via Mirakl	Paze as a UCP credential beside Google Pay
5 · Delegated token (ACP vault)	The shopper picks a saved card; the platform sends it to the merchant's PSP, which returns a single-use token capped by amount, merchant and expiry.	Run the ACP delegate-payment endpoint and vault; mint capped single-use tokens; issue keys to each platform.	**Position.** JPMorgan, not a wallet, holds the credential	Paze cards as the delegated credential

HOW THIS FITS OUR PHASE 1

Our first live merchant runs **use case 4** (hosted UCP with Google Pay) because Google's flow is live and needs only us, Google and the merchant. The build plan puts token acceptance (3) first for reach. Both are cheap if agentic tokens process like today's network tokens: **size use case 3 in Phase 1 discovery** and move it to Required if the change is small.

Correction to the leadership deck: OpenAI moved Instant Checkout into merchants' ChatGPT apps in March 2026, so "ChatGPT through ACP" is no longer a ready Phase 2 channel. ACP lives on as infrastructure. The vault (5) changes our position most, but we build it only when a platform with volume commits to delegated payments.

Sources: Visa newsroom (10 Jun 2026); Mastercard Agent Pay materials; UCP and AP2 specifications; OpenAI Delegated Payment Spec; Digital Commerce 360 (Mar 2026).

Worked example: Meta Muse launched with other wallets attached. Four paths could route its payments through JPMorgan, and the first needs no deal with Meta

MUSE CHECKOUT PATH	WHAT HAS TO HAPPEN	JPMORGAN'S ROLE	USE CASE
Network agentic token at a JPMMS merchant	Meta registers Muse with Visa and Mastercard. No Meta–JPMorgan deal needed.	Accept the token, verify TAP, pass approval to the issuer	3 · likely first
UCP checkout at a JPMMS merchant	The merchant lists JPMorgan as payment handler in its UCP profile, and Muse uses UCP	Payment handler: take the wallet token and mandate	4
Card delegated to our vault	Meta adopts the delegated-payment spec with merchant PSPs	Vault: mint a capped single-use token per order	5
Shopper picks Paze in Muse	Early Warning and Meta add Paze as a Muse wallet	Acquirer, and the bank side's wallet	2
Today: Link one-time card at a JPMMS merchant	Already happening	Acquirer only; recognize the card range	2

WHAT MUSE DOES TODAY

- Launched 8 Sep 2026
- Checkout with PayPal; Link generates one-time cards; Shop Pay to be added
- Asks the user to approve each purchase: shopper-approved by design

Not announced by Meta: network agentic tokens, UCP handlers or delegated payments with merchant PSPs. Rows 1–4 are routes we could prepare for, not commitments.

Lesson: new agents launch with wallets already wired in. Accepting agentic tokens is how we stay in the flow without a deal per agent.

Sources: PaymentExpert (23 Sep 2026); The Paypers; Retail Insight Network. Some path detail in the build plan comes from third-party code analysis not confirmed by Meta.

Paze has a lever in seven of the nine use cases. Most levers need Early Warning's agreement, and none should gate our plan

≈165M

credit and debit cards in Paze as of March 2026

7 + Citi

Seven owner banks, including JPMorgan Chase, plus Citi as the first non-owner issuer

No sign-up

Cards are pre-loaded by issuers; shoppers approve in their bank app; merchants receive network tokens

LEVER	USE CASES	WHAT IT NEEDS	IN OUR PLAN
Paze button in merchant apps and checkouts	1, 2	Nothing new: today's consumer-present Paze	PHASE 1
Paze as a wallet agents call	2	EWS and each agent platform agree	PHASE 2 ARM
Paze banks enable cards for agentic tokens	3	Issuer enablement; Chase can go first	TRACK B
Paze as a UCP credential beside Google Pay	4	EWS publishes a UCP credential handler	PHASE 2 ARM
Paze cards as the delegated credential in our vault	5	Vault built; EWS agrees	IF A PLATFORM COMMITS
Bank app records standing limits and signs intents	6, 7	Paze Agent API (our proposal)	PHASE 2-3
B2B and machine payments	8, 9	Not relevant: no consumer wallet	N/A

Consistent with the leadership deck: Paze stays in Phase 1 in today's form, the agent path is a gated arm, and no gate depends on EWS. The build plan adds the per-use-case view and the competitive point: Link, Shop Pay and PayPal reached Muse first; Paze is the bank side's answer.

Sources: Banking Dive (17 Mar 2026); Paze. Paze has announced no agent features. The build plan's 270M-card year-end target is not independently confirmed and is omitted here.

Autonomy starts with replenishment: the shopper chose the item and merchant once, so a standing limit works like card-on-file. Conditional purchase comes second

USE CASE 6 · FIRST

CLOSEST TO TODAY

Replenishment and renewals

The shopper approves a standing order once, such as dog food monthly under $60. The agent reorders on schedule; nothing new is chosen.

JPMorgan does	Store the agentic token with its standing limit; flag each run as agent-initiated; block runs over the limit; notify the shopper
Capabilities	E agentic tokens · I evidence · **K standing limits** · M agent risk
Risk	Low: known merchant and item; existing stored-credential rules apply
Paze lever	The bank app records the standing limit

USE CASE 7 · SECOND

HIGHER RISK

Conditional purchase

The shopper signs an intent once, such as two concert tickets under $300 by Friday. The agent picks the seller and the moment, and buys when conditions are met.

JPMorgan does	Verify the shopper-signed intent mandate; check each cart against its cap, window and merchant list; attach the mandate to dispute evidence
Capabilities	E agentic tokens · I evidence · **L mandate verification** · M agent risk
Risk	Higher: the agent chooses what, where and when, so a bad pick is likelier and harder to defend
Paze lever	The same bank-app step signs the intent

Fit with our plan: both are "consumer delegates once" (mode C). Our Track B design covers the authority record, limits and revocation for both. The new point is the order: pilot replenishment first, where 52% of shoppers are already comfortable.

Gate to start Wave 3, from the build plan: unattended approval rates close to shopper-approved rates on our own traffic. We propose adding this to the Phase 2 go / no-go.

Mandate verification is a Wave 3 build, not a launch requirement. Survey figure: Amex Trendex (Aug 2026).

B2B procurement agents: the company signs the mandate and the issuer enforces it, so autonomy is acceptable now. JPMorgan can sit on both sides

1 · COMPANY
Sets policy
Finance sets limits, suppliers and categories. This is the standing mandate.

2 · AGENT
Sources
Searches supplier catalogs, compares terms, drafts the order

3 · OWNER
Approves
Budget owner signs orders above a threshold

4 · ISSUER
Scopes a card
Single-use virtual card for this supplier, amount and date

5 · AGENT
Pays
At the supplier's checkout or portal; the supplier's acquirer authorizes

6 · BOOKS
Match
Level 2/3 card data ties invoice to purchase order in the ERP

WHAT JPMORGAN DOES

Issue agent-policy virtual cards by API from our commercial card program; register buyer agents with the networks; acquire on the supplier side; return Level 2/3 data to the buyer's ERP.

WHO SIGNS, WHICH PROTOCOL

The company, not a consumer: the admin's policy is the mandate and the issuer enforces it as card controls. No B2B checkout standard yet; virtual cards plus network agent programs, with AP2 mandates able to carry company policy.

LIVE ELSEWHERE

HSBC and Mastercard pilot B2B agent purchasing on Agent Pay in Singapore (Jun 2026). **Visa and Lianlian** complete a live B2B agent purchase within preset spend controls, agent registered in Visa's Agentic Directory (Jul 2026).

Why it matters: it is the one use case where JPMorgan can be issuer and acquirer on the same agent payment, and where autonomy needs no new consumer trust. It reuses recognition, attribution and agentic token acceptance.

Open questions before a pilot: commercial card sits outside JPMMS, so it needs a joint owner; which procurement platforms our clients use; and whether suppliers' acquirers are mostly us.

Sources: Glenbrook and HSBC (Jun 2026); Crowdfund Insider and Forkast (Jul 2026). Capabilities: A–C base, E agentic tokens, J agent-policy virtual cards, M agent risk model.

Machine payments now have two standards, one of them Stripe's. We keep watching, but should name the trigger that would make us act

HOW USE CASE 9 WORKS

An agent pays per API call, data set or compute minute. The service quotes a price, the agent pays from a card or a balance, and access follows in seconds. No human approves each payment.

STANDARD	BACKED BY	RAILS
Machine Payments Protocol (MPP)	Stripe and Tempo; Visa helped write the card spec	Fiat and crypto; launched on Tempo, Mar 2026
x402	Coinbase	HTTP "402 Payment Required"; mostly stablecoins

WHAT A PSP WOULD BUILD (CAPABILITY N)

- Accept per-call payments through MPP's card spec and x402
- Batch micro-amounts so card economics work
- Decide whether to settle in stablecoins

> **Our stance stays "watch".** The leadership deck puts stablecoin and machine settlement outside this decision; the build plan agrees by placing it last, behind every other capability.

TRIGGER 1

A JPMMS enterprise merchant asks to sell API or data access per call

TRIGGER 2

Visa or Mastercard put the MPP card spec into a network program

TRIGGER 3

JPMorgan's wider stablecoin and deposit-token work offers a settlement path we can reuse

Sources: Fortune (18 Mar 2026); The Defiant. Triggers are proposed here, not in the build plan.

The build plan's fourteen capabilities fit our four product capabilities. Six are new to our plan, and B2B cards fall outside JPMMS

BUILD PLAN CAPABILITY	USE CASES	OUR PRODUCT CAPABILITY	OUR PHASE	STATUS AGAINST THE LEADERSHIP DECK
A · Agent recognition	1–9	Agent connectivity	Phase 1 (TAP if needed)	COVERED
B · Merchant and agent onboarding	1–8	Agent connectivity	Phase 1	SHARPEN Add Mirakl Nexus and merchant-agent registration
C · Attribution and risk baseline	1–9	Optimization and evidence	Phase 1 Required	SHARPEN Add the agent-context field
D · Wallet and agent-card handling	2	Payment execution	Phase 1	NEW Link card ranges; wallet tokens without agent marks
E · Agentic token acceptance	3, 6–8	Payment execution	Size in Phase 1; Track B	COVERED
F · In-agent step-up	3–5	Authority and trust	Phase 2	NEW Passkey or 3DS shown inside the chat
G · UCP payment handler	4	Agent connectivity	Phase 1 Required	COVERED Hosted UCP with Google Pay
H · Delegated payment vault (ACP)	5	Payment execution	If a platform commits	NEW We had an ACP adapter, not a vault
I · Dispute evidence pack	3–7	Optimization and evidence	Design in Phase 1	SHARPEN Add Verifiable Intent to its inputs
J · Agent-policy virtual cards	8	Outside JPMMS: commercial card	Parallel discovery	NEW Needs a commercial card owner
K · Standing-limit credentials	6	Authority and trust	Track B → Phase 2	NEW As a named build; implied in our delegation record
L · Mandate verification	7	Authority and trust	Phase 2–3	COVERED AP2 checks
M · Agent risk model	6–9	Decision Platform	Phase 2–3	NEW Score agent identity and mandate scope, not device
N · Machine micropayments	9	Outside this decision	Watch	DEFERRED

Letters follow the build plan. Our four product capabilities and phases are on leadership deck pages 6 and 9. "New" means not named in the leadership deck, not necessarily new technology.

The two plans agree on direction. They differ on the first proof point, ChatGPT, B2B and dates, and each difference has a clear resolution

TOPIC	BUILD PLAN V4	LEADERSHIP DECK	RECOMMENDATION
First proof point	Wave 1 is visibility on existing rails: use cases 1–2, no new checkout	One live Google UCP checkout path, plus labels and reporting	**Keep ours, widen it.** Labels and attribution are common to both; add the agent-context field so use cases 1–2 are counted from day one.
Agentic tokens versus UCP first	Tokens (3) first for reach; UCP (4) second	UCP first; TAP conditional	**Size tokens in discovery.** If acceptance is close to today's token processing, run both in Phase 1.
ChatGPT and ACP	Vault only when a platform commits; ChatGPT moved checkout to apps	"ChatGPT through ACP" in Phase 2	**Adopt the build plan.** Update leadership deck pages 11 and 31.
Where consent lives	Passkey per purchase; standing limits stored with the token (K)	Consent in the Chase app; gateway keeps the authority record	**Compatible.** K and L become parts of our authority record; issuer-side consent stays our differentiator.
B2B procurement	Pilot now, in parallel from Wave 2	Not covered	**Add as discovery, not build.** Joint owner with Commercial Card; bring back a scoped pilot at the Phase 1 gate.
Timing	Calendar waves: now–mid 2027, 2027, 2027–28, 2028 on	Gates, no dates	**Keep gates.** Use the build plan's dates as planning assumptions only.
Gate tests	Networks publish agent dispute rules; unattended approvals near shopper-approved	Five-outcome scorecard	**Adopt both** as tests in the Phase 2 and Phase 3 gates.
Exit metrics	Agent share · approval agent vs human · disputes per 1,000	Five outcomes	**Use their three** as the Phase 1 metrics under our scorecard.

Leadership deck page references are to the 36-page version of October 2026.

Proposed changes: five edits to the leadership deck and one new decision

EDITS TO THE LEADERSHIP DECK

PAGE	CHANGE
9	**Phase 1 scope:** add the agent-context field to the Required attribution row; add "size agentic token acceptance" to Conditional
11, 31	**Phase 2:** replace "ChatGPT through ACP" with "ACP vault if a platform with volume commits"
3, 16	**Horizons and patterns:** add agent-referred checkout in the merchant's own app; cite Forrester, Amex and Walmart data
5, 21	**Right to win:** list the JPMorgan–Mirakl partnership as an asset already in market
11, 35	**Gates:** add "networks publish agent dispute rules" and "unattended approvals near shopper-approved" as gate tests; use the three exit metrics for Phase 1

PROPOSED DECISION 4

Open a B2B procurement-agent discovery with Commercial Card

Name a joint owner, identify two client procurement platforms, and size how often JPMorgan is both card issuer and supplier acquirer. Bring a scoped pilot to the Phase 1 gate.

Not asked for: build funding. B2B reuses Phase 1 recognition and attribution.

Unchanged: the bounded Phase 1, Paze in today's form, delegated purchasing in design only, and no liability-shift promise.
